

British National Grid preferred transformation

1.

Select an alternative transformation and click OK to close the window. This will create a new shapefile using a different, less accurate transformation. This can then be deleted by right clicking and selecting **Remove Layer**.

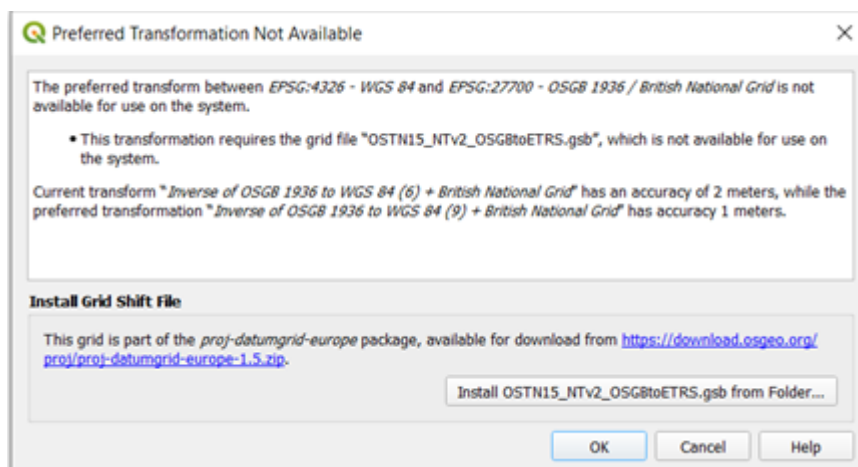

Then you will need to click “Details” in the yellow warning banner at the top of QGIS.

2.

You will then see the following window. Click the link in this window and save the downloaded folder to your computer. You will then need to unzip this folder.

Following this, click the install button in the error window and select the location of the unzipped file you have just downloaded and click “OK”. This installs the necessary files to the QGIS system.

You can now accurately reproject data from WGS 84 to British National Grid.
